

Please expand the documentation in the following code, maintaining and replicating the style of the comments already present.

```
def merge_dicts(base, override):  
    """  
    Merge two dictionaries, with values from  
    override taking precedence.  
    Returns a new dictionary; neither input is  
    mutated.  
    """  
    result = base.copy()  
    for key, value in override.items():  
        if isinstance(value, dict) and key in  
        result and isinstance(result[key], dict):  
            result[key] =  
merge_dicts(result[key], value)  
        else:  
            result[key] = value  
    return result
```

Here's an expanded version that keeps the existing concise, practical docstring style while adding details about behavior, recursion, and return values:

 Python

 Run

```
def merge_dicts(base, override):  
    """  
    Merge two dictionaries, with values from override taking precedence.  
  
    Nested dictionaries are merged recursively when the same key exists  
    in both inputs and both corresponding values are dictionaries.  
    For all other value types, the value from override replaces the  
    value from base.  
  
    Returns a new dictionary; neither input is mutated. Any nested  
    dictionaries that are merged are also copied into the returned  
    structure rather than modified in place.  
  
    Args:  
        base: The original dictionary providing default values.  
        override: The dictionary whose values take precedence and may
```

replace or extend values from base.

Returns:

A new dictionary containing the recursive merge of base and override.

Example:

```
>>> merge_dicts(
...     {"db": {"host": "localhost", "port": 5432}},
...     {"db": {"port": 5433}}
... )
{'db': {'host': 'localhost', 'port': 5433}}
"""
result = base.copy()
for key, value in override.items():
    if isinstance(value, dict) and key in result and isinstance(result[key], dict):
        result[key] = merge_dicts(result[key], value)
    else:
        result[key] = value
return result
```

If you want the comments to remain extremely minimal and in the same style as the original two-line docstring, I can produce a shorter expansion as well.
