

Please expand the documentation in the following code, maintaining and replicating the style of the comments already present.

```
def load_config(path):  
    # open file  
    with open(path) as f:  
        # parse and return  
        return json.load(f)  
  
def save_config(path, data):  
    # write json  
    with open(path, "w") as f:  
        json.dump(data, f, indent=2)
```

Here's an expanded version that preserves the existing terse, line-by-line comment style while adding more useful context:

 Python

 Run

```
def load_config(path):  
    # open file for reading  
    with open(path) as f:  
        # parse JSON content and return  
        # resulting Python object  
        return json.load(f)  
  
def save_config(path, data):  
    # open file for writing  
    # create or overwrite existing file  
    with open(path, "w") as f:  
        # serialize Python object as JSON  
        # use indentation for readability  
        json.dump(data, f, indent=2)
```

If you'd like the comments to be more comprehensive, I can also expand them into a fuller "internal documentation" style while keeping the same lowercase comment convention.
